# Engineering Specification, Installation, Operation and Maintenance Series LF933GD / LF633GD

Electronic Control Valve (for Electric Valve Positioning)

Sizes: 11/4" to 24"

#### **A** WARNING

Read this Manual BEFORE using this equipment.
Failure to read and follow all safety and use information can result in death, serious personal injury, property damage, or damage to the equipment.

Keep this Manual for future reference.

### **A** WARNING

Local building or plumbing codes may require modifications to the information provided. You are required to consult the local building and plumbing codes prior to installation. If the information provided here is not consistent with local building or plumbing codes, the local codes should be followed. This product must be installed by a licensed contractor in accordance with local codes and ordinances.

**Need for Periodic Inspection/Maintenance:** This product must be tested periodically in compliance with local codes, but at least once per year or more as service conditions warrant. All products must be retested once maintenance has been performed. Corrosive water conditions and/or unauthorized adjustments or repair could render the product ineffective for the service intended. Regular checking and cleaning of the product's internal and external components helps assure maximum life and proper product function.

#### NOTICE

For Australia and New Zealand: Pipeline strainers should be installed between the upstream shutoff valve and the inlet of the backflow preventer.

It's important that this device be tested periodically in compliance with local codes, but at least once per year or more as service conditions warrant. If installed on a fire sprinkler system, all mechanical checks, such as alarm checks and backflow preventers, should be flow tested and inspected internally in accordance with NFPA 13 and NFPA 25.

## Series LF933GD

## Electronic Control Valve (for Electric Valve Positioning)

### Full Port Ductile Iron Single Chamber Valve

#### **Features**

- Designed to operate with SCADA telemetry systems
- Valve throttles open or closed by intermittently energizing Solenoid (2) and (3)
- · Adjustable Opening and Closing Speed
- Optional Electronic Controller provides local adjustment and control
- · Solenoid Bypass valves allow manual operation

### **Standard Components**

- 1 Main Valve (905GD Single Chamber)
- 2 2-Way Solenoid (closing)
- 3 2-Way Solenoid (opening)
- 4 Adjustable Closing Speed
- 5 Adjustable Opening Speed
- SB Solenoid Bypass
- X Isolation Cocks

### **Options and Accessories**

- O FC Flo-Clean Strainer
- O Y Y-Strainer (Replaces Flo-Clean)
- O P Position Indicator
- O L Limit Switch

### Operation

The Electronic ACV is designed to be electrically positioned to control flow, pressure, level or temperature for water applications. It is a throttling valve controlled by two 2-way solenoids installed in the pilot control system, one connecting the valve cover chamber with upstream pressure and the other connecting the main valve cover chamber downstream. By alternately energizing the solenoids, line pressure is admitted to or relieved from the cover chamber of the main valve, allowing the valve to be "positioned" to maintain a desired value.

The valve is normally interfaced with SCADA systems or a Programmable Logic Controller that compares a Process Variable (PV) to a desired setpoint, and energizes the solenoid pilots to throttle the valve open or closed until the PV reaches the desired setpoint.

Rate of valve operation is controlled by separate adjustable Opening and Closing Speed Controls that control the rate fluid and pressure are admitted to or relieved from the main valve cover chamber.

The valve is constructed with two "normally closed" solenoids allowing the valve to "hold last position" upon power failure. The valve may also be configured to open fully or close drip tight upon power failure if desired.

Specify valve to "hold last position", "open fully" or "close drip tight" upon power failure prior to ordering.

\*The wetted surface of this product contacted by consumable water contains less than 0.25% of lead by weight.

#### NOTICE

The information contained herein is not intended to replace the full product installation and safety information available or the experience of a trained product installer. You are required to thoroughly read all installation instructions and product safety information before beginning the installation of this product.

## **M Series Basic Valves**

## Electronic Control Valve (for Electric Valve Positioning)

### Full Port Ductile Iron Single Chamber Basic Valve

This Ames Automatic Control Valve (ACV) is a full port, single chamber basic valve that incorporates a one-piece disc and diaphragm assembly. This assembly is the only moving part within the valve allowing it to open, close, or modulate as commanded by the pilot control system.

Ames ACV Main Valves are Lead Free. The Ames ACV piloting system contains Lead Free\* components, ensuring all of our configurations are Lead Free compliant.

Globe Pattern Single Chamber Basic Valve (905GD) Angle Pattern Single Chamber Basic Valve (905AD)

### Standard Materials

**Body and Cover:** Ductile Iron ASTM A536

Coating: NSF Listed Fusion Bonded Epoxy

Lined and Coated

Trim: 316 Stainless Steel

Elastomers: Buna-N (standard)

EPDM (optional) Viton™ (optional)

Nut, Spring and Stem: Stainless Steel

Anti-Scale (Optional): Xylan Coated Stem and Seat

Viton™ is a trademark of The Chemours Company FC, LLC

### **Operating Pressure**

Threaded = 400psi (27.6 bar) 150# Flanged = 250psi (17.2 bar) 300# Flanged = 400psi (27.6 bar) Grooved End = 400psi (27.6 bar)

### **Operating Temperature**

Buna-N: 160°F (71°C) Maximum EPDM: 300°F (140°C) Maximum Viton™: 250°F (121°C) Maximum

Epoxy Coating\*\*: 225°F (107°C) Maximum

\*\* Valves can be provided without internal epoxy coating consult factory

| ప         | Cv Factor GPM (Angle)                         | 26   | 27  | 57  | 91   | 125 | 207  | 571  | 889  | 1530 | 1945 |       |       |

- Maximum continuous flow based on velocity of 20 ft. per second.
- Maximum intermittent flow based on velocity of 25 ft. per second.
- Minimum flow rates based on a 20-40 psi pressure drop.
- The  $C_v$  Factor of a value is the flow rate in US GPM at 60°F that will cause a 1psi drop in pressure.
- C<sub>v</sub> factor can be used in the following equations to determine Flow
  (Q) and Pressure Drop (ΔP):

Q (Flow) =  $C_v \sqrt{\Delta P}$ 

 $\Delta P$  (Pressure Drop) =  $(Q/C_v)^2$ 

- The C<sub>v</sub> factors stated are based upon a fully open valve.
- Many factors should be considered in sizing control valves including inlet pressure, outlet pressure and flow rates.
- For sizing questions including cavitation analysis consult Watts with system details.

## ACV Standard Components - Series LF933GD

## **Model S2W**

## 2-Way Solenoid

Size: 1/8" - 1/2" NPT

Model S2W are pilot system 2-way solenoids. The solenoids can control valves independently or in combination with other control circuit pilots or accessories. Product is available with a wide range of options including: voltage (24VDC, 24VAC or 120VAC), operation (energize to open or closed) and a range of enclosures (general service to watertight to explosion proof).

### **Specifications**

Body Material: Brass (standard)

Stainless Steel (optional)

Elastomers: Nitrile (standard)

EPDM (optional) Viton™ (optional)

24VDC, 24VAC or 120VAC Voltage:

Enclosure:

General Purpose – NEMA 4 (standard) Explosion Proof – NEMA 6, 6P, 7, 9 (optional)

Normally Open or Normally Closed\*\* Action:

\*\*Solenoid Action only. Main valve action (energize-to-open or energize-to-close) is dependent on the particulars of the pilot system.

\*\*\*Brass solenoids when used as part of a pilot system including an ACV main valve comply with the Lead Free Law.

Viton™ is a trademark of The Chemours Company FC, LLC

Model S2W Brass

Model S2W Stainless Steel

## **Model LFFC**

## Flow Control

Size: Standard Flow - ½" MNPTx %" FNPT High Flow - ½" MxF NPT

A Flow Control is an adjustable device used for tuning valve performance. It can be installed to either control the opening or closing the speed of the automatic control main valve. When the flow is in the direction of the needle the flow control is an adjustable restriction. In the free flow direction the seat moves out of the flow path to all unrestricted flow.

Specifications

Size: Standard Flow - 1/2" MNPT x 3/8" FNPT

High Flow - 1/2" MxF NPT

Body Material: Lead Free Brass

Stainless Steel (optional)

Seat: Lead Free Brass

Needle: Stainless Steel (304)

Elastomers: Buna-N (standard)

\*The wetted surface of this product contacted by consumable water contains less than 0.25% of lead by weight.

Large Flow

## **Model BV**

### **Ball Valve**

Size: 1/4" - 1" NPT

Model BV Ball Valves are used in pilot lines to provide a positive shutoff in any override or maintenance situation for simple trouble shooting. This 2-piece, full port valve features: bottom loaded stems, PTFE seats and packing.

Lead Free Ball Valve

## **Model LF60**

## Flo-Clean Strainer

Size: 1/4" - 3/4" NPT

Model LF60 Flo-Clean Strainers are used to filter the fluid passing through the pilot circuit, and provide protection to pilot circuit speed controls and pilots. It is installed in the inlet body port of the Main Valve, exposing the strainer element to main line flow. The currents and flow across the screen create a self-scouring effect, cleaning the filter element.

Model LF60

### Valve inlet with Filter installed

### **Specifications**

Body Material: Lead Free Brass (standard)

Stainless Steel (optional)

Pressure Rating: 400psi (27.6 bar)

Filter Element: Monel

Screen Mesh: 40 Mesh (standard)

## Model 50

## **Position Indicator**

When specified as an option on a Control Valve, the Model 50 Position Indicator is installed in the topmost cover port of the Main Valve and allows for visual indication of valve position. The Model 50 is also very useful during valve start-up and troubleshooting procedures.

A stainless steel indicating rod threads into the tapped portion of the Main Valve stem and moves inside of a cylindrical Pyrex sight tube. The indicating rod travels up and down, following Main Valve stem movement. The housing protects the sight tube and indicating rod, and allows visibility on two sides. The screw driver operated test cock installed on the top of the Model 50 housing provides a controlled method of removal of air from the cover chamber during start-up or troubleshooting of the Main Valve.

| Item | Description                 |
|------|-----------------------------|
| 1    | Test Cock                   |
| 2    | Housing                     |
| 3    | Gasket                      |
| 4    | Pyrex Sight Tube            |
| 5    | Body                        |
| 6    | Indicating Rod              |
| 7    | Stem Adaptor (8" or Larger) |

Model LF50

### **Specifications**

## Model 51

## Single Limit Switch

The Model 51 Single Limit Switch provides visual indication of valve position, as well as remote electrical indication of "valve open" or "valve closed". The single pole double throw Micro-Switch can be connected to open or close an electrical circuit when the valve opens or closes.

The adjustable collar is normally set to contact the trip arm when the main valve is closed. The collar can be positioned on the stem by loosening the set-screw to actuate the switch at the desired point of valve travel.

Single Pole Double Throw Switch

Model LF51

### **Specifications**

### Installation

Start-up of an automatic control valve requires that proper procedures be followed. Time must be allowed for the valve to react to adjustments and the system to stabilize. The objective is to bring the valve into service in a controlled manner to protect the system from damaging over-pressure.

- 1. Prior to installation, flush line to remove debris.
- 2. Install valve so the flow arrow matches flow through the line, and gauges to monitor valve inlet and outlet pressures. A Position Indicator can be installed to provide visual indication of valve position and operation without disassembly.
- 3. Install isolation valves upstream and downstream of the main valve.
- 4. Provide adequate clearance for valve servicing and maintenance. Refer to valve servicing dimensions on next page. Avoid installing valves 6" and larger in the vertical position (main valve stem horizontal). Automatic Control Valves (ACVs) are designed for horizontal in-line installation, with the cover facing up (main valve stem vertical). Slow operation or premature stem and guide wear may occur if valve is not installed according to factory recommendations. Consult factory for detailed engineering review prior to ordering if valve is to be installed other than horizontally in-line.
- 5. If valve is equipped with a pilot control system, extra precautions should be made during installation to protect the piping circuit from damage. Only remove the pilot control system from the valve if necessary. Tubing and fittings should be kept clean and replaced exactly as removed. Consult appropriate hydraulic schematic to ensure proper re-assembly.
- 6. Connect solenoid wiring leads to desired switching device, using safe, standard electrical practices.
- 7. After installation, vent entrapped air from valve cover and pilot system by following the instructions in the **Setting the Solenoid Control Valve** section on the following page.

## **Valve Servicing Dimensions**

The following tables detail the recommended minimum valve servicing dimensions.

#### Globe

| Size (in) | 1¼ | 1½ | 2  | 2½ | 3  | 4  | 6  | 8  | 10 | 12 | 14 | 16 | 20 | 24 |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| A (in)    | 16 | 16 | 20 | 22 | 22 | 24 | 32 | 34 | 38 | 44 | 48 | 52 | 56 | 56 |
| B (in)    | 10 | 10 | 12 | 14 | 14 | 16 | 24 | 26 | 28 | 30 | 34 | 40 | 48 | 48 |

#### Angle

| Size (in) | 11⁄4 | 1½ | 2  | 2½ | 3  | 4  | 6  | 8  | 10 | 12 | 14 | 16 |
|-----------|------|----|----|----|----|----|----|----|----|----|----|----|
| C (in)    | 16   | 16 | 20 | 22 | 22 | 24 | 32 | 34 | 38 | 44 | 48 | 52 |
| D (in)    | 10   | 10 | 12 | 14 | 14 | 16 | 24 | 26 | 28 | 30 | 34 | 40 |

### **Setting the Solenoid Control Valve Valve Function Options**

#### STEP 1

Pre-set pilots as noted:

Opening and Closing Speed - Turn the adjustment screws on

the Closing Speed and Opening Speed Controls, if the main valve is so equipped, OUT, counterclockwise, 1½ to 2½ turns from full closed position.

#### STEP 2

Energize the solenoid to check actuation and to confirm connection to power source.

#### STEP 3

Actuate the solenoids so that initial valve filling is against the closed main valve.

### STEP 4

To ensure proper operation, any trapped air will need to be bled off the valve cover during startup. If your ACV includes a bleed valve, use a flat head screwdriver to slowly open the valve (See Figure 1).

If your valve does not include a bleed valve, bleed air by loosening a fitting on the valve or a plug, at the highest point of the valve assembly.

#### STEP 5

Pressure the line, by opening the upstream isolation valve slowly Air is vented through the air bleed valve or loosened fitting. Tighten the fitting when liquid begins to vent (See Figure 1).

Repeat the process until no air is trapped in the system.

#### STEP 6

Energize/De-Energize each solenoid to open main valve.

#### STEP 7

Opening Speed Flow Control Adjustment: The Opening speed needle valve restricts flow out of the cover of the main valve.

If the main valve is opening too slowly turn the adjustment screw OUT, counterclockwise, increasing the rate of opening (See Figure

If the main valve is opening too quickly, turn the adjustment screw IN, clockwise, decreasing the rate of opening (See Figure 2A).

Energize/De-Energize each solenoid to hold main valve position.

#### STEP 9

Energize/De-Energize each solenoid to close main valve.

#### STEP 10

Closing Speed Needle Valve Adjustment: The closing speed needle valve regulates fluid pressure into the main valve cover chamber, controlling the valve closing speed.

If the main valve is opening too quickly, turn the adjustment screw OUT, counterclockwise, increasing the rate of closing.

- Electrically positioned by actuating one opening and/or one closing 2-way solenoids
- Valve actuation options are:
  - Valve remains closed when NO inlet and NC outlet solenoids are de-energized
  - Valve fully opens when NC inlet and NO outlet solenoids are de-energized
  - Valve holds in last position when NC inlet and NC outlet solenoids are de-energized
- Valve position can be modulated by pulsing either solenoid
- Solenoid override by-pass ball valves provided for manual

Figure 1 Position Indicator

### Clockwise to DECREASE rate of opening

#### Counterclockwise to INCREASE the rate of opening

### **Automatic Control Valve Maintenance Schedule**

To ensure peak performance and longevity of your automatic control valve, Watts/Ames recommends following the below standard maintenance schedule.

### • Monthly Maintenance

- Visual inspection of valve(s) for leaks
- Inspect for proper operation(s); exercise valve.

### • Quarterly Maintenance

- Conduct monthly inspection.
- Validate/Re-establish necessary setpoints of controls/pilots.

#### Annual Maintenance

- Conduct monthly & quarterly inspections.
- Inspect & clean all strainers.
- Inspect valve coating, touch up as required.

#### • 3-5 Year Maintenance

- Conduct monthly, quarterly, & annual maintenance.
- Inspect & replace valve elastomers (diaphragm, O-rings, valve/pilot seats)
- Re-establish necessary set points of controls/pilots.

## **Troubleshooting Guide**

#### **A** WARNING

**Warning:** The valve cannot be serviced under pressure. Upstream and downstream Isolation Valves must be installed to protect system piping. Accurate diagnosis and trouble-shooting requires the valve to open fully, and may subject downstream piping and equipment to high pressure and/or flow rates. The downstream Isolation Valve should be kept closed while diagnosing the valve.

Extreme caution should be used while performing the troubleshooting techniques listed below.

Recommended tools for diagnosis: (3) PRESSURE GAUGES, installed to monitor the inlet pressure, outlet pressure, and cover chamber pressure. If included, a POSITION INDICATOR should be installed to visually assess the position of the disc & diaphragm assembly.

### Test 1: Diaphragm Seal Test

- Close upstream & downstream isolation valves. Close pilot isolation valves or remove pilot control tubing to isolate valve cover from incoming fluid & pressure. Remove uppermost cover plug, test cock, or limit switch.
- 2. With the valve cover chamber vented to atmosphere, partially open the upstream isolation valve, allowing incoming pressure to lift the disc & diaphragm assembly. A volume of water will be displaced from the cover chamber as the valve opens; consult valve specification sheets for approximate cover capacity. A continuous flow of water from the open port indicates a damaged diaphragm or loose disc & diaphragm assembly. Disassemble valve and replace diaphragm or tighten disc & diaphragm assembly.

### **Test 2: Seat Seal Test**

- Close downstream isolation valve and install pressure gauges on an open inlet and outlet port of main valve.
- 2. Open upstream isolation valve to allow pressure on to the valve cover. Allow valve to fully close.
- 3. Monitor downstream pressure gauge; reading should hold steady below incoming pressure. If pressure on downstream side rises to match upstream pressure, leakage is occurring through the seat of the main valve. Disassemble valve, inspect and repair/replace any required parts.
  - a. If gauge pressure rises to match outlet pressure (downstream of closed isolation valve) yet remains below inlet pressure, the isolation valve may be leaking as opposed to main valve seat.

### Test 3: Freedom of Movement/Valve Travel Test

- Close upstream and downstream isolation valves. Install valve position indicator.
- Partially open upstream isolation valve and allow cover to fill with fluid & pressure, closing the valve fully. Mark the position indicator's full closed position.
- Isolate cover chamber from receiving fluid and pressure by closing isolation valves or removing control tubing.
- 4. Carefully vent cover chamber to atmosphere by opening test cock or removing a cover plug. Observe the valve position indicator as the valve travels to the full-open position. The disc & diaphragm assembly should move freely from fully closed to fully open position without binding or "grabbing" at any point during its movement.
  - a. The disc & diaphragm assembly may momentarily "hesitate" while travelling from fully closed to fully open position

     this is a normal characteristic of diaphragm operated control valves, and does not indicate mechanical binding or improper valve operation.
  - A continuous discharge of water from the cover chamber after venting to atmosphere indicates leakage past the diaphragm.
- 5. If necessary, disassemble valve and inspect/repair disc & diaphragm assembly.

## **Troubleshooting Guide**

| Issue                     | Possible Cause                               | Corrective Action   | Notes   |
|---------------------------|--|---|---|
| Main Valve will not open  | Closed isolation valves in pilot system.     | Check isolation valves, ensure open.  |   |
|                           | Insufficient supply pressure.                | Check upstream pressure.  | Depending on water source, supply pressure may not be controlled by valve operator.                                   |
|                           | Main valve stem assembly corroded/ damaged   | Inspect stem assembly, clean/ replace if necessary.   |   |
|                           | Blockage in pilot system.                    | Inspect & clean any installed pilot system strainers, check orifice/speed controls for blockages.             |   |
|                           | Improperly configured opening speed control. | Adjust opening speed control to verify functionality, adjust as required.                                     | Standard setting for opening speed control is 1½ - 2½ turns open from full closed position. Can be adjusted in field. |
| Main Valve will not close | Closed isolation valves in pilot system      | Check isolation valves, ensure open.  |   |
|                           | Diaphragm is damaged                         | Conduct diaphragm seal test, repair and replace if necessary.   |   |
|                           | Main valve stem assembly corroded/damaged.   | Inspect stem assembly, clean/ replace if necessary.   |   |
|                           | Blockage in main valve.                      | Perform freedom of movement test; if valve does not close, disassemble and remove blockage.                   |   |
|                           | Worn/damaged valve seat.                     | Perform seat sealing check; disassemble and inspect/repair seat if required.                                  |   |
|                           | Improperly configured closing speed control. | Adjust closing speed control to verify functionality, adjust as required.                                     | Standard setting for closing speed control is 1½ - 2½ turns open from full closed position. Can be adjusted in field. |
| Solenoid will not actuate | Possible Cause: Low or no voltage            | Check voltage at the solenoid connection, insuring that it has the minimum of 85% of the coils rated voltage. | Should be performed by licensed electrician   |
|                           | Manual operated is engaged                   | Turn manual operator counter-<br>clockwise to disengage   |   |

## **Valve Disassembly Instructions**

Before undertaking valve disassembly, it is recommended to gather the following tools to aid you during the process:

- Small & large adjustable wrenches
- Screwdriver set
- Machinist fine metal file
- Fine wire brush
- Bench vise
- Basic valve IO&M manual
- Hammer & dull cold chisel
- · Heavy-duty ratchet & socket set
- Hexagonal wrench set
- 320 grit/fine Emery cloth
- Appropriate technical bulletins for valve start-up procedures.

- 1. Isolate the valve from line pressure and depressurize it to ensure safe working conditions. Disconnect any electrical connections if so equipped.
- 2. Carefully remove Position Indicator or Limit Switches if equipped. Remove all tubing, fittings, and Control Pilots necessary to easily access and remove the cover. Remove cover nuts and washers.
- 3. Remove the cover. If cover is not free to be removed, loosen it by tapping upward along its outside edge with a dull cold chisel, pictured above.
  - a. Large valves may require the installation of lifting "eye" bolts in order to facilitate cover removal; installation ports are provided on the cover for this purpose.
- 4. Remove the Disc and Diaphragm Assembly from the valve body by lifting straight up.
  - a. Large diameter valves may require a lifting "eye" bolt to be installed in the valve stem accessory threads located on the very top of the valve stem.
- 5. Before removing Stem Nut, examine stem threads for mineral build-up. Remove deposits with a fine wire brush. Extreme care should be taken not to damage the finish on stem guiding surfaces when disassembling. Avoid applying pipe wrenches to top or bottom stem guide surfaces.
- 6. After removing the Stem Nut, the remainder of the Disc & Diaphragm Assembly should disassemble easily. Polish stem guide surfaces with fine emery cloth to remove any mineral deposits and inspect for excessive wear. Remove any mineral build-up from other components with wire brush or by using a Mineral Dissolving Solution. Inspect parts for wear and replace if necessary.
- 7. Inspect valve seat. If seat is not damaged, removal is not necessary. Valve seats 6" and smaller are threaded into the body of the valve and require a seat removal tool (Figure 3) (Table 1 details the tool dimensions for seat removal). Valve seats 8" and larger are held in the valve body with stainless steel cap screws. Remove seat retaining screws and lift seat straight up (Figure 4).

Table 1: Seat Removal Tool Dimension

| Size | A              | В                | С    | D    | E (Dia.) | F    |
|------|----------------|------------------|------|------|----------|------|
| in   | Pipe Size (in) | Min. Length (in) | in   | in   | in       | in   |
| 11⁄4 | 1              | 3.12             | 0.38 | 0.25 | 0.44     | 0.55 |
| 1½   | 1              | 3.12             | 0.38 | 0.25 | 0.44     | 0.50 |
| 2    | 11⁄4           | 3.38             | 0.38 | 0.25 | 0.44     | 0.50 |
| 2½   | 2              | 4.0              | 0.38 | 0.38 | 0.56     | 0.62 |
| 3    | 2½             | 4.5              | 0.50 | 0.38 | 0.56     | 0.62 |
| 4    | 3              | 5.0              | 0.50 | 0.44 | 0.56     | 0.62 |
| 6    | 5              | 6.50             | 0.62 | 0.44 | 0.56     | 0.62 |

### Table 2: Full Port Valve (905GD/905AD) Repair Kits

| Size (in) | 11⁄4    | 1½      | 2       | 21/2    | 3       | 4       | 6       | 8       | 10      | 12      | 14      | 16      |
|-----------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| P/N       | 0677-01 | 0677-01 | 0677-02 | 0677-03 | 0677-04 | 0677-05 | 0677-06 | 0677-07 | 0677-08 | 0677-09 | 0677-10 | 0677-11 |

### Table 3: Reduced Port Valve (605GD/605AD) Repair Kits

| Size (in) | 3       | 4       | 6       | 8       | 10      | 12      | 16      | 20 & 24 |
|-----------|---------|---------|---------|---------|---------|---------|---------|---------|
| P/N       | 0677-02 | 0677-04 | 0677-05 | 0677-06 | 0677-07 | 0677-08 | 0677-09 | 0677-11 |

- 9. Re-Install Disc and Diaphragm Assembly in the valve, taking care not to damage the lower guide area in the center of the valve seat
- 10. Re-install Cover Spring. Replace Valve Cover and tighten Cover Nuts in a crossing pattern to ensure even distribution. Test the Disc and Diaphragm Assembly for smooth travel by following the Freedom of Movement Test procedure in previous section.
- 11. Test the integrity of the Seat Seal by following the Seat Seal Test procedure in previous section.
- 12. Return valve to service by following instructions in the Setting the Solenoid Control Valve section matching the valve function.

<sup>8.</sup> Replace Seat Disc, Diaphragm and Spacer Washers provided in Main Valve repair kit (refer to Table 2 or 3 for correct repair kit part number). Re-assemble in the reverse order of disassembly.

Limited Warranty: Ames Fire & Waterworks (the "Company") warrants each product to be free from defects in material and workmanship under normal usage for a period of one year from the date of original shipment. In the event of such defects within the warranty period, the Company will, at its option, replace or recondition the product without charge.

THE WARRANTY SET FORTH HEREIN IS GIVEN EXPRESSLY AND IS THE ONLY WARRANTY GIVEN BY THE COMPANY WITH RESPECT TO THE PRODUCT. THE COMPANY MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED. THE COMPANY HEREBY SPECIFICALLY DISCLAIMS ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

The remedy described in the first paragraph of this warranty shall constitute the sole and exclusive remedy for breach of warranty, and the Company shall not be responsible for any incidental, special or consequential damages, including without limitation, lost profits or the cost of repairing or replacing other property which is damaged if this product does not work properly, other costs resulting from labor charges, delays, vandalism, negligence, fouling caused by foreign material, damage from adverse water conditions, chemical, or any other circumstances over which the Company has no control. This warranty shall be invalidated by any abuse, misuse, misuse, misupplication, improper installation or improper maintenance or alteration of the product.

Some States do not allow limitations on how long an implied warranty lasts, and some States do not allow the exclusion or limitation of incidental or consequential damages. Therefore the above limitations may not apply to you. This Limited Warranty gives you specific legal rights, and you may have other rights that vary from State to State. You should consult applicable state laws to determine your rights. SO FAR AS IS CONSISTENT WITH APPLICABLE STATE LAW, ANY IMPLIED WARRANTIES THAT MAY NOT BE DISCLAIMED, INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ARE LIMITED IN DURATION TO ONE YEAR FROM THE DATE OF ORIGINAL SHIPMENT.
